MVP OVERVIEW

IB Networking Tracker

An AI pipeline for students recruiting in investment banking: outreach, scheduling, prep, notes, thank-you, follow-up.

Networking pipelines fall apart

Dozens of bankers

Candidates network across many firms and groups in a single recruiting cycle.

Stale spreadsheets

Manual data entry means the tracker is out of date within weeks.

Missed follow-ups

Coffee chats go unprepared and thank-you notes go unsent.

One focus: keep the pipeline organized and moving. Not a job board or resume builder.

Target audience

Who

College students recruiting for investment banking summer analyst roles.

Behavior

They network with dozens of bankers across firms and groups, and track it in a spreadsheet.

Access

Reachable through UVA classmates, McIntire, and finance and investment clubs.

Recruiting repeats every cycle, so the need returns each year.

Current market

Today's option	What it does	Gap for IB recruiting
Spreadsheets	Manual contact and follow-up tracking	Passive; goes stale; all entry and emails by hand
General AI assistants (e.g. Pally)	Connect inboxes, calendar and files to prep meetings	Not built for the IB recruiting loop or firm-level pipeline
Generic CRMs and note apps	Store contacts and tasks	No IB firm database, cadence rules or grounded drafts

Market size: 360,000 applications / year (according https://www.extern.com/post/investment-banking-acceptance-rate-2026)

Paste messy notes, get a pipeline

Pasted note

"talked w/ Jake, 2nd yr analyst GS TMT SF, said follow up in a month and reach out to his VP Priya"

The system creates

- Contact: Jake, Goldman Sachs, TMT, San Francisco
- Logged chat and interaction
- Priya added as a referral lead
- Follow-up scheduled in a month
- Thank-you draft ready to review

What the MVP includes

Paste to records

Emails, LinkedIn text and call notes become contacts, interactions and tasks.

Calendar and reminders

Google Calendar scheduling around conflicts, plus email reminders.

Briefs and drafts

Prep briefs and thank-you drafts. The user reviews and sends.

Firm dashboard

See where you stand with each bank at a glance.

The LLM is core: without it, every field is typed by hand.

Every LLM output is validated first

Check	Rule
Schema	Records match JSON schema; titles are valid IB titles
Firms and groups	Must resolve to a maintained bank database; unknowns flagged, never invented
Duplicates	Duplicate contacts blocked
Dates	Future, correct time zone, no calendar conflict, 5+ business days between follow-ups
Grounding	Every claim about a banker appears in the user's notes; right name and firm; no placeholders
Sending	Never automatic; recruiting alerts use a maintained timeline table

Self-correction loop

1. Generate

LLM returns structured JSON from the user's input.

2. Validate

Errors go back with the input, e.g. "firm 'GS' did not resolve".

3. Retry

Regenerate up to 3 times.

4. Ask

Still failing? Ask the user: "Goldman Sachs or Guggenheim?"

Failures are logged by type to improve prompts over time.

How we will test the app

1. Recruit testers

UVA students in McIntire and finance clubs, using their real pipelines this season.

2. Run real usage

Testers paste actual notes and emails, schedule chats, and send reviewed drafts.

3. Measure

Compare against their spreadsheet habits and log every validation failure by type.

Metric	Success signal
Accuracy	Share of records accepted without edits: [target %]
Follow-ups	Missed follow-ups per tester vs. their old tracker
Retention	Testers still pasting notes weekly after [N] weeks

Stack and rollout

Free-tier stack

- Next.js on Vercel
- FastAPI on Render
- Supabase: Postgres and auth
- Google OAuth and Calendar API
- LLM API with JSON output

Beta with real users

- UVA classmates, McIntire, finance clubs
- Test on real pipelines this recruiting season
- Google OAuth testing mode: up to 100 users
- Users paste LinkedIn text: no scraping
- Team seeds bank, group and timeline tables
